Receiving at the mobile router, access control filter information originating from an access control source, wherein the access control filter information is received at least in part over the bi-directional radio link via the mobility anchoring agent; configuring a first access control module at the mobile router with the access control filter information; filtering uplink packets by the first access control module according to the access control filter information to eliminate unauthorized uplink packets; and transmitting the filtered uplink packets from the mobile router to the mobility anchoring agent over the bi-directional radio link

### ***Reason for Allowance***

1. This action is in response to the amendment and RCE filed 1/06/2011.
2. Claims 2-6, 11, 19, 20 and 32-34 have been amended. Applicant amended specification to add required 371 national stage filing data, per supplement on 5/19/2011.
3. Claim 1, 7-10, 12-18, 21-31 and 35-38 are cancelled.
4. Claims 39-48 have been added.

### ***Allowable Subject Matter***

5. Claims 2-6, 11, 19, 20, 32-34 and 39-48 are allowed over prior art.

The following is a statement of reasons for the indication of allowable subject matter:

Its, Interpreted, the prior art of record either singularly or in proper combination fails to teach receiving at the mobile router, access control filter information originating from an access control source, wherein the access control filter information is received at least in part over the bi-directional radio link via the mobility anchoring agent; configuring a first access control module at the mobile router with the access control filter information; filtering uplink packets by the first access control module according to the access control filter information to eliminate unauthorized uplink packets; and transmitting the filtered uplink packets from the mobile router to the mobility anchoring agent over the bi-directional radio link.

Acharya et al. (US6829709), Tamura et al (US7912477) and Le et al. (US7668145) in combination discloses routers performing a transformation of packets

as they enter and leave the IP core network, filtering packet in downlink and uplink direction and controlling a connection between a first node and a second node by packet filtering function such that packets are discarded in source or destination address.

However, the cited reference fails to teach each step receiving at the mobile router, access control filter information originating from an access control source, wherein the access control filter information is received at least in part over the bi-directional radio link via the mobility anchoring agent; configuring a first access control module at the mobile router with the access control filter information; filtering uplink packets by the first access control module according to the access control filter information to eliminate unauthorized uplink packets; and transmitting the filtered uplink packets from the mobile router to the mobility anchoring agent over the bi-directional radio link. Therefore, the prior art of record either singularly or in combination fails to teach the above claimed limitations for claim 37, 44 and 47 is therefore the reason for allowance. All dependent claims are therefore allowed under same reasons set forth above.

***Conclusion***

6. The prior art made not relied upon but considered pertinent to applicant's disclosure is made of record and listed on form PTO-892
